Kreisförmige Deckenausschnitte kennzeichnen die in ihrer gesamten Ausdehnung erlesbare Untersicht des Stahlbetondachs über dem neuen «Forum» des Eckenberg-Gymnasiums in Adelsheim. Der Neubau bildet zur Straße hin eine lichtdurchflutete zweigeschossige Aula, im rückwärtigen Teil bindet eine Galerie mit Café und Bibliothek auf verschiedenen Ebenen an den Bestand aus den 1960er- und 1970er-Jahren an. Die Hauptlast des Dachs wird von drei zentralen, linear angeordneten Stützen getragen. Von deren Auflagern spannt das quadratische Dach zu einer Reihe kleinerer Stützen direkt an der Fuge zum Altbau sowie zu denen mit T-förmigen Stützenköpfen in den

- a Dachöffnung Ø 1400 mm mit öffnbarer Lichtkuppel
 b Dachöffnung Ø 1000 mm mit Metaldampflampe
 c zykloidische Deckenaussparung Ø 2000 mm
 d zykloidische Deckenaussparung Ø 1500 mm

- a Ø 1400 mm roof opening with operable rooflight dome
 b Ø 1000 mm roof opening metal-halide lamp
 c Ø 2000 mm cycloid coffer
 d Ø 1500 mm cycloid coffer

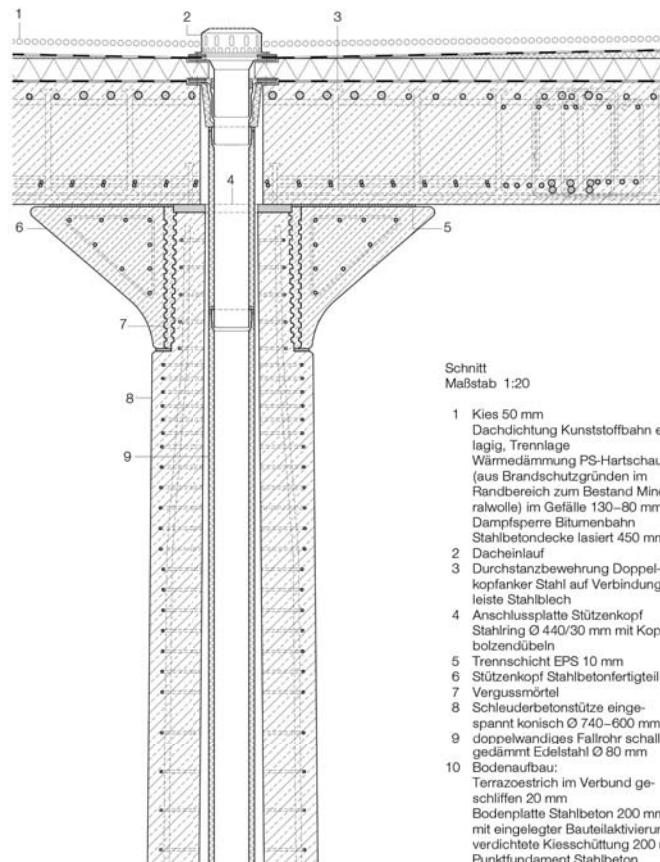

- 1 Kies 100 mm
 Dachdichtung Kunststoffbahn einlagig, Trennlage
 Wärmedämmung PS-Hartschaum im Gefälle 130–80 mm (im Randbereich zum Bestand hin aus Brandabschutz gründen Mineralwolle)
 Dampfsperre Bitumenbahn
 Stahlbetondecke lasiert 450 mm
 2 Lichtkuppel PMMA dreischalig
 3 Aufsatzkranz GFK zweischalig gedämmt
 4 Metaldampflampe
 5 Dachrand Sonnenschutzkasten
 Aluminiumblech gekantet 2 mm
 6 Dachrandabdeckung Aluminiumblech gekantet eloxiert 1 mm
 7 Isolierverglasung opak
 8 Isolierverglasung
 9 Verkleidung Aluminiumblech eloxiert gekantet 1 mm auf Unterkonstruktion / Hinterlüftung
 Wärmedämmung Mineralwolle 160 mm
 Stahlbeton 360 mm
 10 Schiebetür verglast in Aluminiumrahmen
- 1 100 mm gravel
 plastic sealing layer, separating layer
 130–80 mm PS rigid foam thermal
 insulation to fall
 (mineral wool in edge zone toward
 existing building for fire safety considera-
 tions)
 bituminous sheeting vapour barrier
 450 mm reinforced concrete deck,
 semi-transparent coating
 2 PMMA triple glazed rooflight dome
 3 double-walled GRP curb, insulated
 4 metal-halide lamp
 5 solar control encasement at roof's
 edge
 6 coping: 1 mm aluminium sheet, bent
 to shape, anodised
 7 double glazing, opaque
 8 double glazing
 9 1 mm aluminium sheet cladding,
 anodised, bent to shape on supporting
 structure/ventilated cavity
 160 mm mineral wool thermal
 insulation
 360 mm reinforced concrete
 sliding glass door in aluminium frame

The entire underside, which is characterised by circular coffers, of the reinforced concrete roof atop the new Forum at this secondary school in Adelsheim is visible. The school addition takes the shape of a bright, two-storey hall along the street; at its rear a gallery with library and café links different levels of the addition to the existing structures, which date to the 1960s and 1970s.

The main load of the roof is borne by a row of three central columns. From their bearing surfaces, the square concrete deck spans to a row of smaller columns at the juncture to the older buildings, as well as to the T-shaped support heads incorporated in the concrete posts of the south facade. Outwardly identical to the non-loadbearing facade posts on the other two sides, these tapered steel profiles have a greater material thickness. The glazing and solar protection are positioned just beyond the plane of the edge of the roof and end where the solar control encasement begins. Weight and deflection of the long-span exposed concrete deck are reduced by means of four different types of coffers, which as a desirable side effect, also significantly improves the building's acoustics. In the middle zones of the two rectangular ceiling areas, circular skylights in two sizes, in part equipped with metal-halide lamps, bring light into the inner zones of the space. The regular pattern in the form of cycloid depressions continues through the structurally crucial zone near the columns and the edge of the roof. To create the coffers, broad shaped, seamless styrofoam volumes were mounted to the formwork. Corresponding to the geometry, the reinforcement between them runs diagonally. The concrete gets its marble-white tone from iron cinder – only a lazure was applied following removal of the formwork.

The three tapering main columns made of centrifugal concrete are held in place by large pier foundations. The drainage from the roof flows within their inner cavities. The characteristic support heads were originally intended to direct loads from the ceiling deck. Over the course of the planning process, this role was taken over by steel sleeves placed in the ceiling.
